WHAT'S Doing

R. S. Pyle, your Telephone Manager in Torrance

Meet Lillian Buell, a service representative in one of our telephone business offices. Like business offices. Like service reps everywhere, she answers questions or requests when people call in about their service. We wanted you to meet her because she's typical of the people we like to have working for you—bright, personable, and likes to help others. Naturally, she got plenty of special training before she took over her service desk. That's the way we like to do it... help people like Lillian build careers for themselves while they do a good job for you.

You know that wire that runs from your phone to the pole out-side? It's called a drop wire. With lots of wire. With lots of new phones going in, you've probably seen phone men hooking up these wires. Most always, they have a few small pieces left over. Do they throw these pieces away? Not at all! These "leftovers" are put together into lengths of wire we can use somewhere else. We do it by melting the leftovers down, along leftovers down, along with other scrap metal and cable pieces. And

you'd be surprised . . . just from this reclaimed metal alone we get hundreds of miles of new wire every year. So you see, just like a budget-minded housewife we make good use of our scraps!

Mouth-to-mouth rescue breathing will become the new life saving method used by Pacific Telephone employees in the Torrance area during 1960.

The program was adopted by the company after careful medical study by the National Research Council had shown the mouth-to-mouth method superior to all other manual methods for reviving people who have stopped breathing regardless of cause.

Everyone has an ideal resuscitator with him at all times—his own breathing system. It is ideal because it has the same breathing characteristics as the suffocating victim.

victim.

The three major principles advocated by the American National Red Cross for performing mouth-to-mouth

breathing are:

With the victim on his back,

(1) Open the air passage. This is done by tilting the head back so that the jaw is in a "jutting out" posi-

tion.

(2) Keep the air passage open. This is done by cupping the base of the jaw in the palm of one hand and lifting upward.

(3) Breathe air into the victim. This is done by placing your mouth over the mouth (and/or nose) of the victim and blowing. While breathing into victim, watch chest rise to make sure air passage is clear. Seal nose or mouth with your cheek or hand if air is escaping. Remove mouth, take a deep breath and repeat.

Pacific Rambler **Agency Opening New Facilities**
